Grants and Funding

VR54701 VICTR A Randomized Controlled Trial Comparing Intrathecal Buprenorphine and Intrathecal Morphine for Cesarean Delivery Analgesia Grant Studio Role: Co-Principal Investigator Total Cost: \$500.00	Raymond/Sorabella (PI)	06/2023
VR54148 VICTR Anesthesia Provider's Knowledge, Clinical Practice, and Behavioral Attitudes Towards Administering Sugammadex to Women on Hormonal Contraception The primary purpose of this study is to determine the self-reported knowledge, clinical practice behaviors, and opinions/attitudes of anesthesia providers at VUMC (attendings, residents, SRNAs, CRNAs) regarding the perioperative use of SG in adult female patients who are using hormonal contraception. We seek to identify providers' knowledge regarding the SG-contraception drug interaction, and how and to what extent (or whether) they actualize that knowledge in their clinical practice. Of particular interest, we will determine whether they address this issue with patients beforehand in the preoperative setting, or after the fact before discharge. We will also explore the extent of personal involvement in counseling patients to ensure safety. Our observations to date suggest that much is assumed, but that there is little personal involvement. The survey instrument first explores what they do (behaviors), then turns to what they think (attitudes). The results will be analyzed through the lens of ethics and decision-making, and may have important implications for both departmental policy and our education programs. Importantly, the reported behaviors may or may not confirm intended patient education regarding SG drug interactions, thereby having important quality implications. IRB 192177. Role: Co-Principal Investigator Total Cost: \$2,000.00	Robyn Dwan (PI)	12/2019 - 02/2020
